

## 2.9 Well-Founded Orderings

---

Literature: Franz Baader and Tobias Nipkow: *Term rewriting and all that*, Cambridge Univ. Press, 1998, Chapter 2.

To show the refutational completeness of resolution, we will make use of the concept of well-founded orderings.

# Partial Orderings

---

A (strict) partial ordering  $\succ$  on a set  $M$  is a transitive and irreflexive binary relation on  $M$ .

An  $a \in M$  is called **minimal**, if there is no  $b$  in  $M$  such that  $a \succ b$ .

An  $a \in M$  is called **smallest**, if  $b \succ a$  for all  $b \in M$  different from  $a$ .

## *Notation*

$\prec$  for the inverse relation  $\succ^{-1}$

$\preceq$  for the reflexive closure  $(\succ \cup =)$  of  $\succ$

# Well-Foundedness

---

A (strict) partial ordering  $\succ$  is called **well-founded (Noetherian)**, if there is no infinite decreasing chain  $a_0 \succ a_1 \succ a_2 \succ \dots$  with  $a_i \in M$ .

# Well-Founded Orderings: Examples

---

**Natural numbers.**  $(\mathbb{N}, >)$

**Lexicographic orderings.** Let  $(M_1, \succ_1), (M_2, \succ_2)$  be well-founded orderings. Then let their **lexicographic combination**

$$\succ = (\succ_1, \succ_2)_{lex}$$

on  $M_1 \times M_2$  be defined as

$$(a_1, a_2) \succ (b_1, b_2) \iff a_1 \succ_1 b_1, \text{ or else } a_1 = b_1 \ \& \ a_2 \succ_2 b_2$$

(analogously for more than two orderings)

This again yields a well-founded ordering (proof below).

# Well-Founded Orderings: Examples

---

**Length-based ordering on words.** For alphabets  $\Sigma$  with a well-founded ordering  $>_{\Sigma}$ , the relation  $\succ$ , defined as

$$w \succ w' \quad := \quad \alpha) |w| > |w'| \text{ or} \\ \beta) |w| = |w'| \text{ and } w >_{\Sigma, lex} w',$$

is a well-founded ordering on  $\Sigma^*$  (proof below).

## Counterexamples:

$(\mathbb{Z}, >)$ ;

$(\mathbb{N}, <)$ ;

the lexicographic ordering on  $\Sigma^*$

# Basic Properties of Well-Founded Orderings

---

Lemma 2.16:

$(M, \succ)$  is well-founded if and only if every  $\emptyset \subset M' \subseteq M$  has a minimal element.

# Basic Properties of Well-Founded Orderings

---

Lemma 2.17:

$(M_i, \succ_i)$  is well-founded for  $i = 1, 2$  if and only if  $(M_1 \times M_2, \succ)$  with  $\succ = (\succ_1, \succ_2)_{lex}$  is well-founded.

Proof:

(i) “ $\Rightarrow$ ”: Suppose  $(M_1 \times M_2, \succ)$  is not well-founded. Then there is an infinite sequence  $(a_0, b_0) \succ (a_1, b_1) \succ (a_2, b_2) \succ \dots$

Let  $A = \{a_i \mid i \geq 0\} \subseteq M_1$ . Since  $(M_1, \succ_1)$  is well-founded,  $A$  has a minimal element  $a_n$ . But then  $B = \{b_i \mid i \geq n\} \subseteq M_2$  can not have a minimal element, contradicting the well-foundedness of  $(M_2, \succ_2)$ .

(ii) “ $\Leftarrow$ ”: obvious.

# Noetherian Induction

---

Theorem 2.18 (Noetherian Induction):

Let  $(M, \succ)$  be a well-founded ordering, let  $Q$  be a property of elements of  $M$ .

If for all  $m \in M$  the implication

if  $Q(m')$ , for all  $m' \in M$  such that  $m \succ m'$ ,<sup>a</sup>  
then  $Q(m)$ .<sup>b</sup>

is satisfied, then the property  $Q(m)$  holds for all  $m \in M$ .

---

<sup>a</sup>induction hypothesis

<sup>b</sup>induction step

# Noetherian Induction

---

Proof:

Let  $X = \{m \in M \mid Q(m) \text{ false}\}$ . Suppose,  $X \neq \emptyset$ . Since  $(M, \succ)$  is well-founded,  $X$  has a minimal element  $m_1$ . Hence for all  $m' \in M$  with  $m' \prec m_1$  the property  $Q(m')$  holds. On the other hand, the implication which is presupposed for this theorem holds in particular also for  $m_1$ , hence  $Q(m_1)$  must be true so that  $m_1$  can not be in  $X$ . *Contradiction.*

# Multi-Sets

---

Let  $M$  be a set. A **multi-set**  $S$  over  $M$  is a mapping  $S : M \rightarrow \mathbb{N}$ . Hereby  $S(m)$  specifies the number of occurrences of elements  $m$  of the base set  $M$  within the multi-set  $S$ .

We say that  $m$  is an **element** of  $S$ , if  $S(m) > 0$ .

We use set notation ( $\in$ ,  $\subset$ ,  $\subseteq$ ,  $\cup$ ,  $\cap$ , etc.) with analogous meaning also for multi-sets, e.g.,

$$(S_1 \cup S_2)(m) = S_1(m) + S_2(m)$$

$$(S_1 \cap S_2)(m) = \min\{S_1(m), S_2(m)\}$$

# Multi-Sets

---

A multi-set is called **finite**, if

$$|\{m \in M \mid s(m) > 0\}| < \infty,$$

for each  $m$  in  $M$ .

*From now on we only consider finite multi-sets.*

*Example.*  $S = \{a, a, a, b, b\}$  is a multi-set over  $\{a, b, c\}$ , where  $S(a) = 3$ ,  $S(b) = 2$ ,  $S(c) = 0$ .

# Multi-Set Orderings

---

Let  $(M, \succ)$  be a partial ordering. The **multi-set extension** of  $\succ$  to multi-sets over  $M$  is defined by

$$S_1 \succ_{\text{mul}} S_2 :\Leftrightarrow S_1 \neq S_2$$

$$\text{and } \forall m \in M : [S_2(m) > S_1(m)$$

$$\Rightarrow \exists m' \in M : (m' \succ m \text{ and } S_1(m') > S_2(m'))]$$

Theorem 2.19:

- a)  $\succ_{\text{mul}}$  is a partial ordering.
- b)  $\succ$  well-founded  $\Rightarrow \succ_{\text{mul}}$  well-founded
- c)  $\succ$  total  $\Rightarrow \succ_{\text{mul}}$  total

Proof:

see Baader and Nipkow, page 22–24.
